Education

University of Hertfordshire

BEng (Hons) Robotics and Artificial Intelligence

Hatfield, UK

Sept 2025 – Present

First-year GPA: **4.16 / 4.5**. Seeking a placement year for 2027–28.

Relevant modules: Maths for Robotics and AI (96%), Introduction to Robotics (85%), Robot Design and Build (85%), Digital Electronics (84%, including PCB design and logic circuits), Programming (83%).

Experience

Software Lead

UH Racing Autonomous (UHRA)

Feb 2026 – Present

Hatfield, UK

Software Lead since Sept 2026; software team member from Feb 2026.

- Leading the software team towards Formula Student AI 2027 (July 2027).
- Built acceleration planning and control; UHRA scored its first ever acceleration point.
- Built a skidpad mission in about six hours in simulation.

Robotics Engineer

STRIDE, University of Hertfordshire

Nov 2025 – Present

Hatfield, UK

- Multi-object tracking of robots and the ball, in simulation and on an OAK-D camera.
- Odometry-based localization with visual landmarks for ROBOTIS OP3 humanoids in Webots.

R&D Intern

Robotics Association of Nepal

Jun 2024 – Feb 2025

Lalitpur, Nepal

- Contributed to robotics and applied AI projects, including drone-based afforestation, banana fibre production, and object-detection systems.
- Helped organise the International AI & Robotics Conference and National Youth Council programmes: logistics, technical setup, and participant coordination.
- Delivered workshops in drone simulation, 3D printing, and basic robotics, and mentored students during outreach including Girls in Robotics & AI.

Projects

Formula Student AI

UHRA

2026

write-up

- Planning and control for a driverless Formula Student car: first acceleration point, skidpad lessons, and a lidar + IMU localization roadmap.

Visual Localisation for Humanoid Robots

STRIDE

2025 – Present

write-up

- Phase 1: ground-truth tracking system for robots and the ball, with stable IDs in field coordinates.
- Phase 2: the robot localises itself from goalposts and IMU heading, and keeps the ball's last-seen position when out of view.

PID Line Follower

University coursework

2025

code

- PID line-following Thymio robot with obstacle detection and line recovery. Tuned over 15+ runs: 20% less motion jitter, 30% smoother cornering.

DIY Quadcopter Drone

Robotics Association of Nepal

2024 – 2025

- Built, configured, and flew a quadcopter; improved flight stability by 30% through tuning over 20+ test flights.

Skills

Programming: Python, C++

Robotics: ROS 2 (Humble, Jazzy), Gazebo, Webots, RViz, kinematics

Autonomy: planning and control, localization, Kalman filtering, multi-object tracking

CAD & fabrication: Fusion 360, 3D printing, DesignSpark PCB; designed and built a small RC car prototype (3D-printed parts, servo and DC motor drive)

Drones: building, configuring, and flying DIY drones (QGroundControl, Mission Planner)

Tools: Linux, Git, Docker
